- g. Explain the role of "action" attribute in html form.

Q – 5.a How to execute SQL Select query? Also write down the syntax for fetching the result from the database table. [02]**Q – 5.b** Write a program to create registration page for University Enrollment. Apply proper validation on each field. (Use Regular Expression for the validation purpose) [07]**OR****Q – 5.b** Write a program which generates the session after successful login from the user side. Store the username value in session and display using PHP. [07]**Q – 5.c** Define the following terms [05]
1) `implode()` 2) `explode()` 3) `mysqli_fetch_array()`**OR****Q – 5.c** Briefly explain the concept of associative array in PHP. [05]**Q – 6 Attempt any Two:** [14]

- a. Demonstrate transition and transformation properties in CSS3.
- b. Write a program to create database application in PHP to perform following operations:
 1. Create database called "UnitTest2"
 2. Create table called "student" with fields ID, Name, Email, Phone_Number.
 3. Insert any three student's records
 4. Delete any single record based on ID
 5. Fetch all the details from table.

Please note that in above program phone number column should accept only 10 digits.

- c. Develop Calorie Calculator using PHP programming script.

Hint:

Formula for calculating calories for male and female are following:

female= $655 + (9.6 * \text{weight}) + (1.8 * \text{height}) - (4.7 * \text{age})$;

male= $66 + (13.7 * \text{weight}) + (5 * \text{height}) - (6.8 * \text{age})$;

input: Gender, Age, Weight and Height

Output: Daily Metabolic Rate (use correct calculation).
