

**CHAROTAR UNIVERSITY OF SCIENCE & TECHNOLOGY****First Semester of M. Tech. (ME-AMT) Examination****March 2018****ME782 Casting and Welding Processes****Date: 29.03.2018, Thursday****Time: 10:00 a.m. To 01:00 p.m.****Maximum Marks: 70****Instructions:**

1. The question paper comprises of two sections.
2. Section I and II must be attempted in separate answer sheets.
3. Make suitable assumptions and draw neat figures wherever required.
4. Use of scientific calculator is allowed.
5. One can refer **books/notes**. Exchange of books/notes is not allowed during examination.

**SECTION – I****Q - 1** Answer following multiple choice type questions.**[10]**

- (i) Which of the following ferrous metals have carbon more than 2 percentage:
 

|                     |                      |
|---------------------|----------------------|
| (p) Cast iron       | (q) Carbon steel     |
| (r) Stainless steel | (s) All of the above |
- (ii) Which of the following metals have density less than 7000 Kg/m<sup>3</sup>:
 

|            |                      |
|------------|----------------------|
| (p) Copper | (q) Aluminum         |
| (r) Iron   | (s) All of the above |
- (iii) Which of the following Indian foundry clusters is hub for Investment Casting Process:
 

|                |              |
|----------------|--------------|
| (p) Coimbatore | (q) Kolhapur |
| (r) Rajkot     | (s) Belgaum  |
- (iv) Which of the following is filling related defects:
 

|               |                      |
|---------------|----------------------|
| (p) Blow hole | (q) Hot tear         |
| (r) Shrinkage | (s) All of the above |
- (v) During mold filling, there occurs:
 

|                                   |                                   |
|-----------------------------------|-----------------------------------|
| (p) Oxidation of advancing front  | (q) Change in physical properties |
| (r) Stream separation and merging | (s) All of the above              |
- (vi) In metal casting process, sources of gases are:
 

|                   |                      |
|-------------------|----------------------|
| (p) Entrapped Air | (q) Diffused gases   |
| (r) Core gases    | (s) All of the above |
- (vii) In general for sand casting, high resistance to heat transfer is offered:
 

|                               |                             |
|-------------------------------|-----------------------------|
| (p) In solidified metal       | (q) At metal-mold interface |
| (r) At liquid-solid interface | (s) In mold material        |
- (viii) During solidification, phase change occurs at constant temperature in:
 

|                     |                           |
|---------------------|---------------------------|
| (p) Pure metals     | (q) Hypo-Eutectic alloys  |
| (r) Eutectic alloys | (s) Hyper-Eutectic alloys |
- (ix) Feeding distance depends on:
 

|                              |                            |
|------------------------------|----------------------------|
| (p) Size of the feeder       | (q) Location of the feeder |
| (r) Thickness of the casting | (s) All of the above       |
- (x) Draft allowance is provided on:
 

|                                      |                                   |
|--------------------------------------|-----------------------------------|
| (p) Faces normal to draw direction   | (q) Faces along the parting plane |
| (r) Faces parallel to draw direction | (s) All of the above              |

**Q - 2** For an aluminum alloy (10% Si) cuboid casting, having 20 X 30 X 50 cm dimensions, design a cylindrical top feeder along with the connecting neck to ensure it is free from shrinkage porosity. Then calculate the yield. Take height to diameter ratio of feeder as 2.

**[09]****OR**

- Q - 2 (a)** For an aluminum alloy (10% Si) cuboid casting, having 20 X 30 X 50 cm dimensions, poured into a silica sand mold, compute the solidification time. Take  $k_{\text{mold}} = 0.8 \text{ W/m-K}$ ,  $\rho_{\text{mold}} = 1500 \text{ Kg/m}^3$ ,  $C_{\text{mold}} = 1100 \text{ J/Kg-K}$ ,  $\rho_{\text{metal}} = 2700 \text{ kg/m}^3$ ,  $C_{\text{metal}} = 900 \text{ J/kg-K}$ ,  $\Delta H_{\text{metal}} = 400 \text{ KJ/Kg}$ ,  $T_{\text{melting}} = 600^\circ\text{C}$ , and ambient temperature =  $30^\circ\text{C}$ . **[04]**
- Q - 2 (b)** For above cuboid casting, compute filling time if gate of 1 sq. cm cross-section area is connected at the top of the casting. Consider sprue height as 20cm. **[05]**
- Q - 3** Attempt *any four*: **[16]**
- Why foundry engineers want to ensure directional solidification inside cast components? Discuss the means to achieve the same with illustration.
  - Discuss the influence of pouring at under superheat and over superheat temperature on quality of castings.
  - “Feeder efficiency can be improved by connecting more number of cavities with common feeder”. Justify the statement with brief discussion.
  - Discuss various elements of cost involved during cast product manufacturing.
  - State the difference between shrinkage porosity and gas porosity with illustration.

### **SECTION – II**

- Q - 4** Answer following multiple choice type questions. **[10]**
- Which one of the following welding processes consist of minimum heat affected zone:
 

|                                |                        |
|--------------------------------|------------------------|
| (p) Shielded metal arc welding | (q) Ultrasonic welding |
| (r) Metal inert gas welding    | (s) Laser beam welding |
  - In resistance welding, the resistance should be highest:
 

|                      |                                                  |
|----------------------|--------------------------------------------------|
| (p) Inside electrode | (q) At interface between workpiece and electrode |
| (r) Inside workpiece | (s) At interface between two workpieces          |
  - The electrodes used in welding are coated. This coating is not expected to:
 

|                                           |                                          |
|-------------------------------------------|------------------------------------------|
| (p) Provide protective atmosphere to weld | (q) Prevent electrode from contamination |
| (r) Stabilize the arc                     | (s) Add alloying elements                |
  - Which of the following belongs to the category of plastic welding?
 

|                       |                        |
|-----------------------|------------------------|
| (p) Explosion welding | (q) Resistance welding |
| (r) Gas welding       | (s) Laser beam welding |
  - Arc blow occurs due to:
 

|                                         |                                   |
|-----------------------------------------|-----------------------------------|
| (p) Magnetic field around the electrode | (q) Ionization of arc             |
| (r) Electric field around the electrode | (s) Ionization of surrounding air |
  - The heat generated in resistance welding is expressed by:
 

|             |                       |
|-------------|-----------------------|
| (p) $I^2Rt$ | (q) $IR^2t$           |
| (r) $IRt^2$ | (s) None of the above |
  - Which of the following welding techniques uses a consumable electrode?
 

|                   |                     |
|-------------------|---------------------|
| (p) Laser welding | (q) Thermit welding |
| (r) TIG welding   | (s) MIG welding     |
  - For welding plates of thickness less than 5 mm, its edges:
 

|                                               |                                      |
|-----------------------------------------------|--------------------------------------|
| (p) Do not require beveling                   | (q) Should have double-V or U-groove |
| (r) Should be beveled to single-V or U-groove | (s) None of the above                |
  - In general, voltage required for heating in electric resistance welding is in the range:
 

|                    |                     |
|--------------------|---------------------|
| (p) 1 to 5 volts   | (q) 6 to 10 volts   |
| (r) 11 to 20 volts | (s) 50 to 100 volts |
  - The brazing process is carried out in the temperature range:
 

|                                                                           |                               |
|---------------------------------------------------------------------------|-------------------------------|
| (p) Below $450^\circ\text{C}$ and above solidus temperature of weld metal | (q) Below $450^\circ\text{C}$ |
| (r) Above $450^\circ\text{C}$ and below solidus temperature of weld metal | (s) Above $450^\circ\text{C}$ |

**Q-5** Differentiate between the Friction welding and Friction Stir welding, giving scientific reasoning. **[05]**

**OR**

**Q-5** Differentiate between Design for Manufacturing and Design for Manufacturability in the context of either cast or weld components. **[05]**

**Q-6** Attempt *any Five*: **[20]**

- (a)** Discuss the reasons for generation of residual stresses in welded joints.
- (b)** Explain the variation in mechanical properties across the heat affected zone (HAZ) in a butt-welded joint using arc welding process.
- (c)** Briefly discuss various sources of heat that can be used to perform welding operation.
- (d)** Why welding flux is an essential aspect of welding process such as submerged arc welding?
- (e)** Explain why is the tungsten inert –gas welding preferred for welding aluminum plates.
- (f)** “In automatic arc welding, flat power source characteristic is desirable”. Justify the statement with neat sketch.
- (g)** Briefly explain the working principle of the Submerged Arc Welding (SAW) process and mention their applications.
