10. What did you _____ last night? (Use the appropriate form of verb 'read')

B Read the passage carefully and write the answers of the given questions.

10

Earthquakes are the sudden shock of the earth's surface that result in the earth shaking and rolling. They can be felt over large geographical areas for brief moments of time. This is a natural way for the earth to release stress. There are nearly 20 tectonic plates that are along the earth's surface that continuously move past each other. When these plates stretch or squeeze, huge rocks form at their edges and the rocks shift causing an earthquake. A seismograph is an instrument used to record the strength of the earthquake. It also measures how long the earthquake occurs. Tsunamis are formed by the displacement of water, either a landslide, volcanic eruption or by the slippage of the earth's plates, rock about 15-200 kilometers (50,000-650,000 feet) deep that carry the continents and seas of the earth on an underground ocean of hot, semi-solid material. Tsunamis are large ocean waves that flow straight avoiding any winding and circular turns like most every day waves. Tsunamis travel up to 965 kph, thus capable of causing severe damage with their treacherous speed alone.

Questions:

1. Define the term 'Earthquake'.
2. What are reasons the behind the Earthquakes?
3. What are the uses of Seismograph?
4. What are the reasons behind Tsunami?
5. How Tsunami is the most dangerous than any other natural calamities?

C Draft a resume for the post of a Pharmacist at AIDS Healthcare Foundation, New Delhi.

10

Q 4 Attempt any TWO of the following:

20
